Generates [AsciiDoctor](#) files to document Ecore metamodels, similar to [JavaDoc](#). AsciiDoctor can be rendered as HTML, PDF, or Eclipse Help. EcoreDoc can be used as [Maven](#) Plugin, standalone command-line tool, or as Java API.

1. Overview

EcoreDoc's [Java API](#) works on a list of [EClassifiers](#). [Maven Plugin](#) and [Standalone Command-Line Tool](#) take all [EClassifiers](#) from one or more `*.ecore` or `*.xcore` files.

EcoreDoc creates one output document containing all passed [EClassifiers](#). They are grouped by containing [EPackage](#). The output document contains documentation, all properties of supported elements, and cross-references to all usages of each element.

EcoreDoc currently supports the following elements:

- [EPackage](#)
- [EDatatype](#)
- [EEnum](#)
- [EEnumLiteral](#)
- [EClass](#)
- [EAttribute](#)
- [EReference](#)

EcoreDoc is highly configurable via the [Generator Configuration](#).

The homepage and repository of EcoreDoc can be found at <https://gitlab.manatree.io/MDEAssets/EcoreDoc>. Please use the issue tracker at this site for any feature requests or bugs.

2. Java API

The [Java API](#) is available as [Maven artifact](#) `com.altran.general.emf.ecoredoc:com.altran.general.emf.ecoredoc.generator` or [OSGi bundle](#) `com.altran.general.emf.ecoredoc.generator.ebr`.

The [Generator Configuration](#) is contained in [Maven artifact](#) `com.altran.general.emf.ecoredoc:com.altran.general.emf.ecoredoc.generator.config` or [OSGi bundle](#) `com.altran.general.emf.ecoredoc.generator.config.ebr`.

The main interface is `com.altran.general.emf.ecoredoc.generator.EcoreDocGenerator`. The constructor takes the list of [EClassifiers](#) to generate documentation for.

The `getConfig()` method returns a fully initialized `com.altran.general.emf.ecoredoc.generator.config.EcoreDocGeneratorConfig` that can be changed to adjust the [Generator Configuration](#).

The `generate()` method returns a `CharSequence` containing the complete AsciiDoctor output document.

3. Maven Plugin

The Maven Plugin is available as Maven artifact `com.altran.general.emf.ecoredoc:ecoredoc-maven-plugin`.

It supports the following configuration settings:

inputFiles (required)

The list of Ecore metamodel files to create documentation for.

outputFile (required)

The output file to write the generated AsciiDoctor document to.

By convention, the file extension is `.adoc`.

If the file exists, it will be overwritten and a warning is emitted.

resolve (default: false)

Whether EcoreDoc should explicitly try to resolve all references in the *inputFiles*. Might be necessary for highly interconnected metamodels.

config (default: unchanged default config)

Customized [Generator Configuration](#).

The *config* contents stricly follow the structure and naming relative to [Class EcoreDocGeneratorConfig](#), easiest explained with an example.

Assume the *inputFiles* contain two *EPackages*, namely *EPackage1* and *EPackage2*.

EPackage1 contains, among others, two *EClasses*, named *MyEClass* and *Class3*. The latter one contains, among others, the *EAttribute* named *specialNumber*.

EPackage1 also contains an *EEnum* named *Enum1*.

pom.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<project xmlns="http://maven.apache.org/POM/4.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
http://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>

  <artifactId>my-artifact-id</artifactId>

  <dependencies>
    <dependency>
      <groupId>com.altran.general.emf.ecoredoc</groupId>
      <artifactId>ecoredoc-maven-plugin</artifactId>
    </dependency>
  </dependencies>
```

```

<build>
  <plugins>
    <plugin>
      <groupId>com.altran.general.emf.ecoredoc</groupId>
      <artifactId>ecoredoc-maven-plugin</artifactId>

      <configuration>
        <resolve>true</resolve>

        <config>
          <renderDefaults>>false</renderDefaults>
          <documentTitle>This is the title of my document</documentTitle>
          <ePackages>
            <ePackage>
              <targetEPackage>EPackage1</targetEPackage>
              <eClasses>
                <eClass>
                  <targetEClass>MyEClass</targetEClass>
                  <repeatInherited>>false</repeatInherited>
                </eClass>
                <eClass>
                  <targetEClass>Class3</targetEClass>
                  <eAttributes>
                    <eAttribute>
                      <targetEAttribute>specialNumber</targetEAttribute>
                      <render>>false</render>
                    </eAttribute>
                  </eAttributes>
                </eClass>
              </eClasses>
              <eEnums>
                <eEnum>
                  <targetEEnum>Enum1</targetEEnum>
                  <renderDefaults>>true</renderDefaults>
                </eEnum>
              </eEnums>
            </ePackage>
            <ePackage>
              <targetEPackage>EPackage2</targetEPackage>
              <renderDefaults>>true</renderDefaults>
            </ePackage>
          </ePackages>
        </config>
        <inputFiles>
          <inputFile>EPackage1.ecore</inputFile>
          <inputFile>EPackage2.ecore</inputFile>
        </inputFiles>
        <outputFile>output.adoc</outputFile>
      </configuration>
    </plugin>
  </plugins>

```

```
</build>
</project>
```

This example sets the following configuration:

- `renderDefaults` for all contents: `true`
- `documentTitle`: `This is the title of my document`
- `repeatInherited` for `MyEClass`: `false`
- `render` for `specialNumber`: `false`
- `renderDefaults` for `Enum1`: `true`
- `renderDefaults` for `EPackage2`: `true`

4. Standalone Command-Line Tool

The standalone command-line tool is available as Maven artifact `com.altran.general.emf.ecoredoc:com.altran.general.emf.ecoredoc.standalone`.

Use the following command to invoke. Please replace `${ecoredoc-version}` with your version of EcoreDoc:

```
java -jar com.altran.general.emf.ecoredoc.standalone-${ecoredoc-version}-jar-with-dependencies.jar <options>
```

If invoked without options, it will print the following help:

Generates reference documentation for ecore models.

The output is inspired by JavaDoc and formatted in AsciiDoctor format. AsciiDoctor can easily be rendered to HTML, PDF, or Eclipse help.

Usage:

EcoreDocGenerator [parameters] [List of ecore files to generate]

If unspecified, the output file name will be "<firstEcoreFile.ecore>.adoc"

Parameters:

```
-r,
--resolve: Resolve external references

-o <outputFile>,
--output <outputFile>: Specify output file name.
```

```

--documentTitle <title>: Set title of output document

--positionEDataTypes <pos>: Set rendering position of all EDataTypes within EPackage

--positionEEnums <pos>:      Set rendering position of all EEnums within EPackage

--positionEClasses <pos>:    Set rendering position of all EClasses within EPackage

[+|-]defaults:    [Enable|disable] rendering of default values

[+|-]bounds:      [Enable|disable] rendering of multiplicity bounds
                  (overwrites defaults parameter)

[+|-]inherited:   [Enable|disable] repetition of inherited features

[+|-]useCases:    [Enable|disable] rendering of use cases
                  (references to other usages of this element)

[+|-]subTypes:    [Enable|disable] rendering of sub-types

[+|-]superTypes:  [Enable|disable] rendering of super-types

```

Examples:

```

EcoreDocGenerator my.ecore
Generates the documentation of my.ecore into my.ecore.adoc

```

```

EcoreDocGenerator some/path/to/my.ecore other.ecore
Generates the documentation of some/path/to/my.ecore and other.ecore
into some/path/to/my.ecore.adoc

```

```

EcoreDocGenerator -r my.ecore
Tries to resolve all external references in my.ecore and
generates the documentation of my.ecore and referenced models into my.ecore.adoc

```

```

EcoreDocGenerator -defaults +bounds my.ecore
Generates the documentation of my.ecore and referenced models into my.ecore.adoc
without rendering default values, but still rendering multiplicity bounds

```

```

EcoreDocGenerator --positionEClasses 1 --positionEEnums 2 --positionEDataTypes 3
my.ecore
Generates the documentation of my.ecore and referenced models into my.ecore.adoc
with all EClasses first, then all EEnums, and finally all EDataTypes

```

```
EcoreDocGenerator -o output.adoc my.ecore other.ecore
Generates the documentation of my.ecore and other.ecore into output.adoc
```

5. EcoreDoc Metamodel Annotation

Any of the [Generator Configuration](#) options can be used as Ecore Annotation. These options will be used by default; any external options take precedence over annotation options.

EcoreDoc will throw an `IllegalArgumentException` if an EcoreDoc annotation contains an illegal value.

5.1. Ecore Annotation

Create an `EAnnotation` on the annotated element with source <http://altran.com/general/emf/ecoredoc/generator/config/0.1>. Within this annotation, create one key/value pair for each option.

The source identifier might change in the future! However, it should be possible to maintain backwards compability.

- ▼ id : EString
 - ▼ GenModel
 - documentation -> Enables proper merging in {@link com.altran.general.emf.ecoredoc.util.EcoreMerger}.
 - ▼ 0.1
 - render -> false
- (:) EString

| Properties ⓘ | |
|--------------|---|
| Property | Value |
| References | |
| Source | http://altran.com/general/emf/ecoredoc/generator/config/0.1 |

Example Ecore annotation on EAttribute `id` (sets `render` for `id` to `false`)

5.2. Xcore Annotation

First, register the annotation.

EcoreDoc annotation registration

```
annotation "http://altran.com/general/emf/ecoredoc/generator/config/0.1" as EcoreDoc
```

Afterwards, we can use the annotation as usual.

Example Xcore annotation on EAttribute **name** (sets *render* for **name** to *false*)

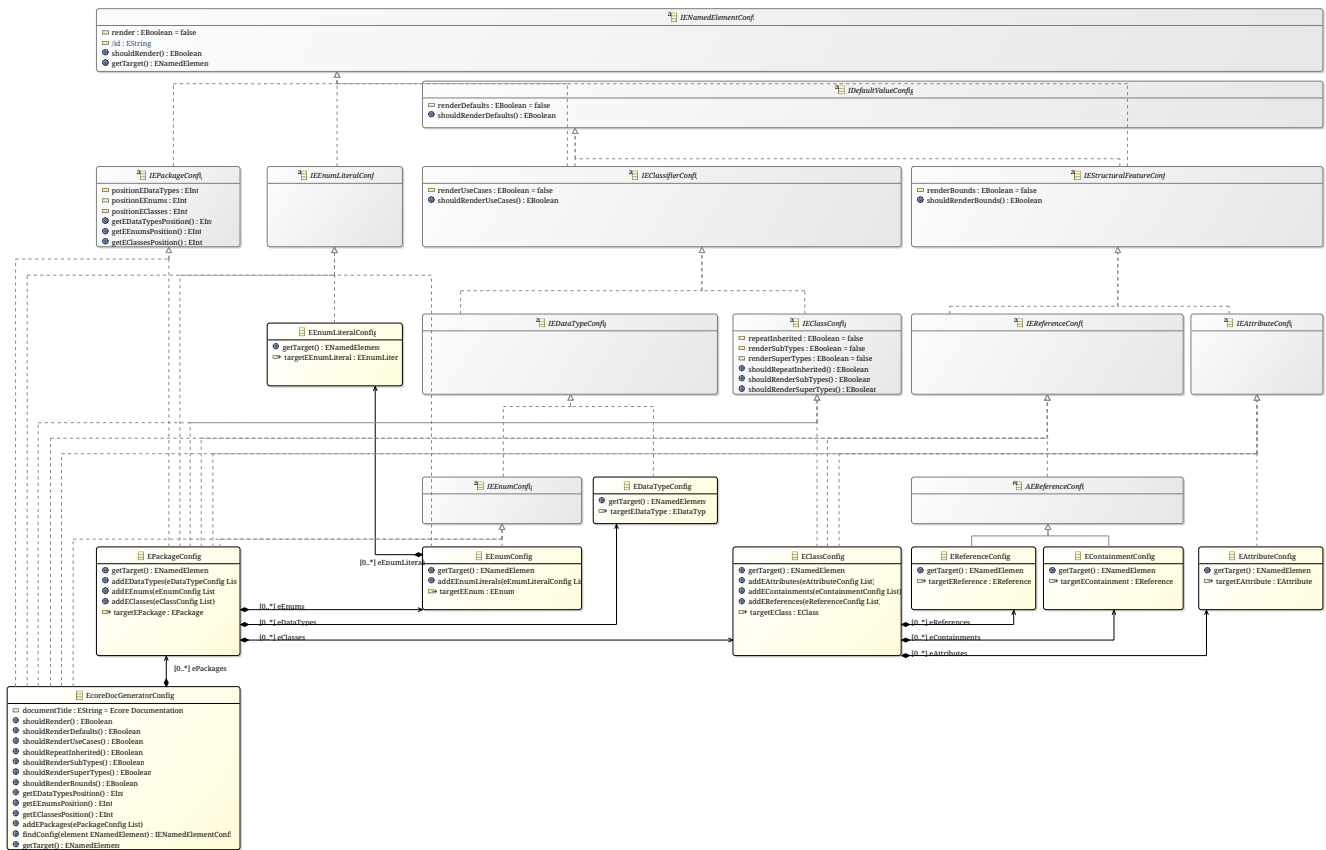

```
@EcoreDoc(
  render="false"
)
String name
```

6. Generator Configuration

The generator configuration is an Ecore metamodel, so we obviously use EcoreDoc to create the documentation listed below.

The most important parts are:

- Class [EcoreDocGeneratorConfig](#) as model root, also describing the customization hierarchy
- Interface [INamedElementConfig](#), implemented by all elements
- Interface [IDefaultValueConfig](#), implemented by all elements except Class [EEnumLiteralConfig](#)
- Interface [IEClassifierConfig](#)
- Interface [IEClassConfig](#)
- Interface [IEPackageConfig](#)
- Interface [IEStructuralFeatureConfig](#)

| Name | Type | Properties | Description |
|------------------|------------------|------------|-------------|
| targetEReference | ecore.EReference | [0..1] | |

Used at

- [config.EClassConfig.eReferences](#)

6.10. Class EcoreDocGeneratorConfig

Root for the detailed EcoreDocGenerator configuration.

The configuration allows to specify configuration options for each element and all its contained elements. It always chooses the most specific configuration setting.

Example:

```
EcoreDocGeneratorConfig * renderDefaults: {unset, defaults to true} * repeatInherited: false +
EPackage1 * renderDefaults: false + EClass1 + EAttribute1 * renderDefaults: true + EAttribute2 {no
custom config} + EClass2 extends EClass1 + EPackage2 * repeatInherited: true + EClass3 extends
EClass1 + EClass4 + EAttribute3 * renderDefaults: true * repeatInherited: false
```

Result:

EPackage1

renderDefaults false
repeatInherited false

EClass1

renderDefaults false
repeatInherited false

EAttribute1

renderDefaults true
repeatInherited false

EAttribute2

renderDefaults false
repeatInherited false

EClass2

renderDefaults false
repeatInherited false

EPackage2

renderDefaults true
repeatInherited true

EClass3

```
renderDefaults true
repeatInherited true
```

EClass4

```
renderDefaults true
repeatInherited true
```

EAttribute3

```
renderDefaults true
repeatInherited false
```

Super-types

- [config.IDefaultValueConfig](#)
- [config.IEAttributeConfig](#)
- [config.IEClassConfig](#)
- [config.IEClassifierConfig](#)
- [config.IEDataTypeConfig](#)
- [config.IEEnumConfig](#)
- [config.IEEnumLiteralConfig](#)
- [config.IENamedElementConfig](#)
- [config.IEPackageConfig](#)
- [config.IEReferenceConfig](#)
- [config.IEStructuralFeatureConfig](#)

Attributes

| Name | Type | Properties | Description |
|-------------------------------|-------------------------|---|--|
| documentTitle | EString | [0..1] <i>Default: Ecore Documentation</i> | Title of the generated document. defaults to Ecore Documentation. |

Containments

| Name | Type | Properties | Description |
|---------------------------|---------------------------------------|------------------------|-------------|
| ePackages | config.EPackageConfig | [0..*] | |

6.11. Interface IDefaultValueConfig

Attributes

| Name | Type | Properties | Description |
|-----------------------------|-----------------------|-----------------------------------|--|
| <code>renderDefaults</code> | <code>EBoolean</code> | <code>[0..1]</code> unsettable | Whether properties should be rendered at their default values. Example: If <code>EReference.ordered = true</code> (the default value), the ordered property of that <code>EReference</code> will not be rendered if <code>renderDefaults = false</code> . |

6.12. Interface IEAttributeConfig

Super-types

- [config.IDefaultValueConfig](#)
- [config.INamedElementConfig](#)
- [config.IStructuralFeatureConfig](#)

6.13. Interface IEClassConfig

Super-types

- [config.IDefaultValueConfig](#)
- [config.IEClassifierConfig](#)
- [config.INamedElementConfig](#)

Attributes

| Name | Type | Properties | Description |
|-------------------------------|-----------------------|-----------------------------------|---|
| <code>renderSubTypes</code> | <code>EBoolean</code> | <code>[0..1]</code> unsettable | Whether the list of sub-types should be rendered. |
| <code>renderSuperTypes</code> | <code>EBoolean</code> | <code>[0..1]</code> unsettable | Whether the list of super-types should be rendered. |

| Name | Type | Properties | Description |
|------------------------------|-----------------------|-----------------------------------|--|
| <code>repeatInherited</code> | <code>EBoolean</code> | <code>[0..1]</code> unsettable | Whether inherited features should be repeated. Example: EClass1 has an EAttribute name=attr1. EClass2 extends EClass1. If repeatInherited = true for EClass2, attr1 will be listed in the section of EClass1 and EClass2. Otherwise, attr1 will only be listed in the section of EClass1. |

6.14. Interface IEClassifierConfig

Super-types

- [config.IDefaultValueConfig](#)
- [config.INamedElementConfig](#)

Attributes

| Name | Type | Properties | Description |
|-----------------------------|-----------------------|-----------------------------------|--|
| <code>renderUseCases</code> | <code>EBoolean</code> | <code>[0..1]</code> unsettable | Whether use cases (references to other usages of this element) should be rendered. |

6.15. Interface IEDataTypeConfig

Super-types

- [config.IDefaultValueConfig](#)
- [config.IEClassifierConfig](#)
- [config.INamedElementConfig](#)

6.16. Interface IEnumConfig

Super-types

- [config.IDefaultValueConfig](#)
- [config.IEClassifierConfig](#)
- [config.IEDataTypeConfig](#)
- [config.INamedElementConfig](#)

6.17. Interface IEnumLiteralConfig

Super-types

- [config.INamedElementConfig](#)

6.18. Interface INamedElementConfig

Attributes

| Name | Type | Properties | Description |
|---------------------|-----------------------|-----------------------------------|---|
| <code>render</code> | <code>EBoolean</code> | <code>[0..1]</code> unsettable | Whether this element should be rendered at all. |

6.19. Interface IEPackageConfig

Super-types

- [config.INamedElementConfig](#)

Attributes

| Name | Type | Properties | Description |
|---------------------------------|-------------------|-----------------------------------|--|
| <code>positionEClasses</code> | <code>EInt</code> | <code>[0..1]</code> unsettable | Rendering position of all EClasses within an EPackage. |
| <code>positionEDataTypes</code> | <code>EInt</code> | <code>[0..1]</code> unsettable | Rendering position of all EDataTypes within an EPackage. |
| <code>positionEEnums</code> | <code>EInt</code> | <code>[0..1]</code> unsettable | Rendering position of all EEnums within an EPackage. |

6.20. Interface IEReferenceConfig

Super-types

- [config.IDefaultValueConfig](#)
- [config.INamedElementConfig](#)
- [config.IEStructuralFeatureConfig](#)

6.21. Interface IEStructuralFeatureConfig

Super-types

- [config.IDefaultValueConfig](#)
- [config.INamedElementConfig](#)

Attributes

| Name | Type | Properties | Description |
|---------------------------|-----------------------|-----------------------------------|--|
| <code>renderBounds</code> | <code>EBoolean</code> | <code>[0..1]</code> unsettable | Whether multiplicity bounds should be rendered, even if they are at their default values and <code>renderDefaults = false</code> . |

7. Versions

This asset in version 0.7.0-SNAPSHOT was developed using the following components and versions.

Eclipse

4.7.3a (Oxygen 3a)

Google Guava

19.0

Apache Commons Lang3

3.4

Apache Commons IO

2.2

Apache Maven

3.3.9

Eclipse Ecore

2.12.0

Eclipse Xcore

1.3.1

Eclipse Tycho

1.2.0

8. Known Issues

- If HTML is used in Ecore documentation, the PDF rendering can be faulty ([Issue #12](#))
- `EOperations`, `EParameters`, `EAnnotations` are missing from the documentation ([Issue #13](#), [Issue #15](#))
