Generates AsciiDoctor files to document Ecore metamodels, similar to JavaDoc. AsciiDoctor can be rendered as HTML, PDF, or Eclipse Help. EcoreDoc can be used as Maven Plugin, standalone command-line tool, Java API, or Eclipse Plugin.

1. Overview

EcoreDoc's Java API works on a list of EClassifiers. Maven Plugin, Standalone Command-Line Tool and Eclipse Plug-in take all EClassifiers from one or more *.ecore or *.xcore files.

EcoreDoc creates one output document containing all passed EClassifiers. They are grouped by containing EPackage. The output document contains documentation, all properties of supported elements, and cross-references to all usages of each element.

EcoreDoc currently supports the following elements:

- EPackage
- EDataType
- EEnum
- EEnumLiteral
- EClass
- EAttribute
- EReference
- EOperation
- EParameter

EcoreDoc is highly configurable via the Generator Configuration.

The homepage and repository of EcoreDoc can be found at https://gitlab.manatree.io/MDEAssets/EcoreDoc. Please use the issue tracker at this site for any feature requests or bugs.

2. Java API

The Java API is available as Maven artifact com.altran.general.emf.ecoredoc:com.altran.general.emf.ecoredoc.generator or OSGi bundle com.altran.general.emf.ecoredoc.generator.ebr.

The Generator Configuration is contained in Maven artifact com.altran.general.emf.ecoredoc:com.altran.general.emf.ecoredoc.generator.config or OSGi bundle com.altran.general.emf.ecoredoc.generator.config.ebr.

The main interface is com.altran.general.emf.ecoredoc.generator.EcoreDocGenerator. The constructor takes the list of EClassifiers to generate documentation for.

The getConfig() method returns a fully initialized
com.altran.general.emf.ecoredoc.generator.config.EcoreDocGeneratorConfig that can be changed to
adjust the Generator Configuration.

The generate() method returns a CharSequence containing the complete AsciiDoctor output document.

3. Maven Plugin

The Maven Plugin is available as Maven artifact com.altran.general.emf.ecoredoc:ecoredoc-maven-plugin.

It supports the following configuration settings:

inputFiles (required)

The list of Ecore metamodel files to create documentation for.

outputFile (required)

The output file to write the generated AsciiDoctor document to.

By convention, the file extension is .adoc.

If the file exists, it will be overwritten and a warning is emitted.

resolve (default: false)

Whether EcoreDoc should explicitly try to resolve all references in the *inputFiles*. Might be necessary for highly interconnected metamodels.

config (default: unchanged default config)

Customized Generator Configuration.

The *config* contents stricly follow the structure and naming relative to Class EcoreDocGeneratorConfig, easiest explained with an example.

Assume the *inputFiles* contain two EPackages, namely EPackage1 and EPackage2.

EPackage1 contains, among others, two EClasses, named MyEClass and Class3. The latter one contains, among others, the EAttribute named specialNumber.

EPackage1 also contains an EEnum named Enum1.

pom.xml

```
</dependency>
</dependencies>
<build>
  <plugins>
    <plugin>
      <groupId>com.altran.general.emf.ecoredoc</groupId>
      <artifactId>ecoredoc-maven-plugin</artifactId>
      <!-- make sure EcoreDoc is actually executed -->
      <executions>
        <execution>
          <phase>test</phase>
          <goals>
            <goal>ecoredoc</goal>
          </goals>
        </execution>
      </executions>
      <configuration>
        <resolve>true</resolve>
        <config>
          <renderDefaults>false</renderDefaults>
          <documentTitle>This is the title of my document/documentTitle>
          <ePackages>
            <ePackage>
              <targetEPackage>EPackage1</targetEPackage>
              <eClasses>
                <eClass>
                  <targetEClass>MyEClass</targetEClass>
                  <repeatInherited>false</repeatInherited>
                </eClass>
                <eClass>
                  <targetEClass>Class3</targetEClass>
                  <eAttributes>
                    <eAttribute>
                      <targetEAttribute>specialNumber</targetEAttribute>
                      <render>false</render>
                    </eAttribute>
                  </eAttributes>
                </eClass>
              </eClasses>
              <eEnums>
                <eEnum>
                  <targetEEnum>Enum1</targetEEnum>
                  <renderDefaults>true</renderDefaults>
                </eEnum>
              </eEnums>
            </ePackage>
            <ePackage>
```

This example sets the following configuration:

```
renderDefaults for all contents: false
documentTitle: This is the title of my document
repeatInherited for MyEClass: false
render for specialNumber: false
renderDefaults for Enum1: true
renderDefaults for EPackage2: true
```

4. Standalone Command-Line Tool

The standalone command-line tool is available as Maven artifact com.altran.general.emf.ecoredoc:com.altran.general.emf.ecoredoc.standalone.

Use the following command to invoke. Please replace \${ecoredoc-version} with your version of EcoreDoc:

```
java -jar com.altran.general.emf.ecoredoc.standalone-${ecoredoc-version}-jar-with
-dependencies.jar <options>
```

If invoked without options, it will print the following help:

```
Generates reference documentation for ecore models.

The output is inspired by JavaDoc and formatted in AsciiDoctor format.

AsciiDoctor can easily be rendered to HTML, PDF, or Eclipse help.

Usage:
```

```
EcoreDocGenerator [parameters] [List of ecore files to generate]
If unspecified, the output file name will be "<firstEcoreFile.ecore>.adoc"
Parameters:
  -۲,
  --resolve: Resolve external references
  -o <outputFile>,
  --output <outputFile>: Specify output file name.
  --documentTitle <title>: Set title of output document
  --positionEDataTypes <pos>: Set rendering position of all EDataTypes within EPackage
  --positionEEnums <pos>:
                             Set rendering position of all EEnums within EPackage
  --positionEClasses <pos>: Set rendering position of all EClasses within EPackage
                 [Enable|disable] rendering of default values
 [+|-]defaults:
                  [Enable|disable] rendering of multiplicity bounds
 [+|-]bounds:
                                    (overwrites defaults parameter)
 [+|-]inherited: [Enable|disable] repetition of inherited features
 [+|-]useCases: [Enable|disable] rendering of use cases
                                    (references to other usages of this element)
                 [Enable|disable] rendering of sub-types
 [+|-]subTypes:
 [+|-]superTypes: [Enable|disable] rendering of super-types
Examples:
 EcoreDocGenerator my.ecore
 Generates the documentation of my.ecore into my.ecore.adoc
  EcoreDocGenerator some/path/to/my.ecore other.ecore
 Generates the documentation of some/path/to/my.ecore and other.ecore
  into some/path/to/my.ecore.adoc
 EcoreDocGenerator -r my.ecore
 Tries to resolve all external references in my.ecore and
```

generates the documentation of my.ecore and referenced models into my.ecore.adoc

EcoreDocGenerator -defaults +bounds my.ecore Generates the documentation of my.ecore and referenced models into my.ecore.adoc without rendering default values, but still rendering multiplicity bounds

EcoreDocGenerator --positionEClasses 1 --positionEEnums 2 --positionEDataTypes 3 my.ecore

Generates the documentation of my.ecore and referenced models into my.ecore.adoc with all EClasses first, then all EEnums, and finally all EDataTypes

EcoreDocGenerator -o output.adoc my.ecore other.ecore Generates the documentation of my.ecore and other.ecore into output.adoc

5. Eclipse Plug-in

The Eclipse Plug-in is available as Feature com.altran.general.emf.ecoredoc.ui.feature.

It provides a context menu entry for one or more *.ecore / *.xcore files in the following views:

- Project Explorer
- Package Explorer
- Model Explorer

The command creates one output file next to the first selected input file, named <firstInputFile.ecore>.adoc. The output file contains the documentation of all selected metamodels.

6. EcoreDoc Metamodel Annotation

Any of the Generator Configuration options can be used as Ecore Annotation. These options will be used by default; any external options take precedence over annotation options.

EcoreDoc will throw an IllegalArgumentException if an EcoreDoc annotation contains an illegal value.

6.1. Ecore Annotation

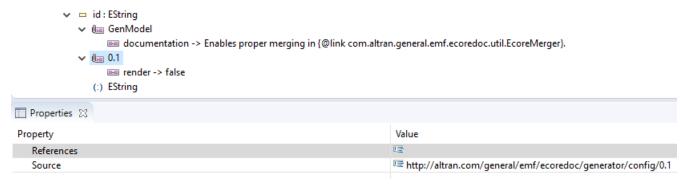

Create an EAnnotation on the annotated element with source

http://altran.com/general/emf/ecoredoc/generator/config/0.1

Within this annotation, create one key/value pair for each option.

The source identifier might change in the future! However, it should be possible to maintain backwards compability.

Example Ecore annotation on EAttribute id (sets render for id to false)

6.2. Xcore Annotation

First, register the annotation.

EcoreDoc annotation registration

```
annotation "http://altran.com/general/emf/ecoredoc/generator/config/0.1" as EcoreDoc
```

Afterwards, we can use the annotation as usual.

Example Xcore annotation on EAttribute name (sets render for name to false)

```
@EcoreDoc(
   render="false"
)
String name
```

7. EOperation Overrides

EcoreDoc understands all possible kinds of inheritance and overrides and marks them accordingly.

We use the following example throughout the section.

```
class SomeClass {
   String myName
   contains SomeClass[0..*] others
}
class Class3 extends SomeClass {}
interface IFace1 {
   op void doIt()
```

```
op void doIt(int i)
}
interface IFace2 {
  op void doIt()
}
abstract class AImplementer extends IFace1, IFace2 {
  op void doIt() {
    println("Hello, World!")
  }
}
interface IFace3 extends IFace1, IFace2 {}
class Implementer extends AImplementer, IFace3 {}
interface If1 {
  op Class3[1..8] getChildren()
}
interface If2 {
  op SomeClass getSome()
  op void setSome(SomeClass[1] someClass)
}
class Cls3 extends If1, If2 {
  contains Class3[] children
  refers SomeClass[1] some
}
class Cl4 {
  refers If1 iface
}
class Cl4b extends Cl4 {
  op Cls3 getIface() {
    super.iface as Cls3
  op void setIface(Cls3 iface) {
    super.iface = iface
  }
}
```

Show inherited Features

If repeatInherited is enabled, we repeat all inherited features (i.e. *EAttributes*, containing *EReferences*, cross-referencing *EReferences*) from all super-types.

We link them to their declaration with symbol \triangle .

We omit inherited features if they are overridden by an EOperation (see below).

In the example, we repeat SomeClass.myName and SomeClass.others in Class3.

Show inherited EOperations

If repeatInherited is enabled, we repeat all inherited *EOperations* from all super-types.

If several super-types declare the same *EOperation* (compared by signature), we repeat this *EOperation* only once and link to all the declarations with symbol \triangle . If one of the declarations defines a body, we repeat that body.

We omit inherited *EOperations* if they are overridden by a Feature (see below).

In the example, we repeat both Iface1.doIt() and Iface2.doIt() once in Iface3, linking to both super-types. We also repeat Iface1.doIt(i) in Iface3.

Show overridden EOperations

If an *EOperation* defines a body and one or more super-types declare the same *EOperation* (compared by signature), we link to all the super-type declarations with symbol \triangle .

In the example, we mark AImplementer.doIt() as overriding Iface1.doIt() and Iface2.doIt().

Show overriding EOperations

If an EOperation is declared in one or more sub-types and they define a body, we link to all sub-types declarations with symbol \bigvee .

In the example, we mark both Iface1.doIt() and Iface2.doIt() as being overridden by AImplementer.doIt().

Show Features overriding EOperation

If the generated code for a feature effectively overrides one or more inherited EOperations, we link from the feature to all overridden EOperations with symbol \blacktriangle .

In this case, we omit the inherited and overridden *EOperations*.

We also link to all features of all sub-types overriding an *EOperation* with symbol ∇ .

In the example, we mark Cls3.children as overriding If1.getChildren(), and Cls3.some as overriding both If2.getSome() and If2.setSome().

Accordingly, we mark If1.getChildren() as being overridden by Cls3.children, and both If2.getSome() and If2.setSome() as being overridden by Cls3.some.

We also omit all the *EOperations* from Cls3, as they are effectively overridden by features.

Show EOperations overriding Features

If an EOperation effectively overrides the generated code of an inherited feature, we link from the EOperation to the overridden feature with symbol \triangle .

In this case, we omit the inherited and overridden feature.

We also link to all *EOperations* of all sub-types overridden a feature with symbol ∇ .

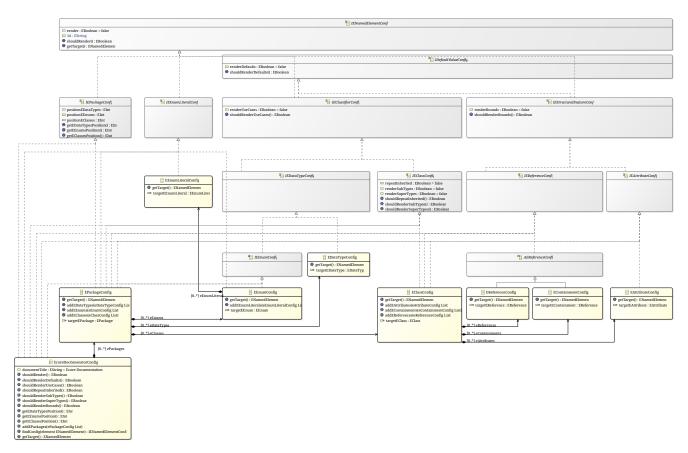

In the example, we mark both Cl4b.getIface() and Cl4b.setIface() as overriding Cl4.iface. Accordingly, we mark Cl4.iface as being overridden by both Cl4b.getIface() and Cl4b.setIface(). We also omit iface from Cl4b as it is effectively overridden by *EOperations*.

8. Generator Configuration

The generator configuration is an Ecore metamodel, so we obviously use EcoreDoc to create the documentation listed below.

The most important parts are:

- Class EcoreDocGeneratorConfig as model root, also describing the customization hierarchy
- Interface IENamedElementConfig, implemented by all elements
- Interface IDefaultValueConfig, implemented by all elements except Class EEnumLiteralConfig
- Interface IEClassifierConfig
- Interface IEClassConfig
- Interface IEPackageConfig
- Interface IEStructuralFeatureConfig

Used at

• config.EClassConfig.eReferences

8.12. Class EcoreDocGeneratorConfig

Root for the detailed EcoreDocGenerator configuration.

The configuration allows to specify configuration options for each element and all its contained elements. It always chooses the most specific configuration setting.

Example:

EcoreDocGeneratorConfig * renderDefaults: {unset, defaults to true} * repeatInherited: false + EPackage1 * renderDefaults: false + EClass1 + EAttribute1 * renderDefaults: true + EAttribute2 {no custom config} + EClass2 extends EClass1 + EPackage2 * repeatInherited: true + EClass3 extends EClass1 + EClass4 + EAttribute3 * renderDefaults: true * repeatInherited: false

Result:

EAttribute3

renderDefaults true repeatInherited false

Super-types

- config.IDefaultValueConfig
- config.IEAttributeConfig
- config.IEClassConfig
- config.IEClassifierConfig
- config.IEDataTypeConfig
- config.IEEnumConfig
- config.IEEnumLiteralConfig
- config.IENamedElementConfig
- config.IEOperationConfig
- config.IEPackageConfig
- config.IEParameterConfig
- config.IEReferenceConfig
- config.IEStructuralFeatureConfig
- config.IETypedElementConfig

Attributes

Name	Туре	Properties	Description
documentTitle	EString	[01] Default: Ecore Documentation	Title of the generated document. defaults to Ecore Documentation.

Containments

Name	Туре	Properties	Description
ePackages	config. EPackageConfig	[0*]	

Name	Aspect and Type	Properties	Description

9. Versions

This asset in version 0.9.0-SNAPSHOT was developed using the following components and versions.

Eclipse

4.7.3a (Oxygen 3a)

Google Guava

19.0

Apache Commons Lang3

3.1

Apache Commons IO

2.2

Apache Maven

3.3.9

Eclipse Ecore

2.12.0

Eclipse Xcore

1.3.1

Eclipse Tycho

1.2.0

10. Known Issues

- If HTML is used in Ecore documentation, the PDF rendering can be faulty (Issue #12)
- EAnnotations are missing from the documentation (Issue #15)
